

GRECOM-PSR-300--battery-slow-charging-mods

it seems build in charger charges with too much current, which makes battery hot. this mods make it charges lower current less than 10 mA, depend on input voltage.

usually, when DC power plug is plugged in, it disconnect (-) battery terminal to GND (-) of DC plug. with 1K ohm between (-) of battery and (-) GND of DC plug, it charges battery slowly.

to isolate normal charging build in radio, it need to cut out parts of terminal in Yellow Battery Case. to make it same as Black Case.

CUT OFF contact circled in RED to make it same as black color battery holder.
